

## Repairing Permissions

Repairing permissions as a troubleshooting step if (especially before and right after installing new software) you find that is a good idea.

**To repair permissions, follow these steps:**

1. Open Disk Utility (in /Applications/Utilities).
2. Select a volume in the list on the left. (volume names are indented)
3. In the First Aid view, click Repair Disk Permissions.

Disk Utility resets the permissions of files installed using Apple's installer.
